

Forklift Grapple

Forklift Grapple - Grapples work together with the crowning operation of the bucket cylinder situated on the excavator. They can mount directly onto the jib or whichever quick hitch which is in bucket position. Grapples are most often used for the processing and handling of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has additional support bridging. This particular manufactured design provides the grapple with utmost strength and support by stopping the body from breaking and turning during its function.

The grapple together with all of its moving parts are constructed of hardened steel. The revolving points are designed to be able to guarantee supreme closing force and holding ability. The one operating it has the capacity to deal with all sizes and varieties of materials due to the jaws built-in at the end part of the grapple with toes. This enables the jaws to close through one another in a finger configuration for maximum handling capacity.
