

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is actually an apparatus made out of top quality materials intended to withstand the most demanding procedures and work environments. This piece of equipment could enable the one driving to be able to operate the forks hydraulically without leaving the seat. Side shifting models have the extra ability to be able to laterally position the entire load or the arms in order to facilitate much more precise carrying and position in a faster and more effective way.

The blade pocket is somewhat unique and enables the individual operating it to securely swing the forks into position without any fear of destroying the positioning cylinders. This could allow the driver the option to execute simultaneous or independent fork movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages can be transformed into blade positioners on existing units.
